                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This is the amino acid sequence of a variant human hepatocyte proliferation substance (HPS). The variant differs from the sequence encoded by T13396 at pos. 214: A to G change and pos. 314: T to C. These changes alter the amino acid residues at pos. 50 of the mature protein: Ile to Val and pos. 83: Leu to Pro. The gene was isolated from a lambda-gt10 human cDNA library using the sequence T13396 as a probe. The human gene was cloned in plasmid pSCL to produce plasmid pSVLH which was subsequently recombined to produce plasmid psCLH of the HPS gene is under control of the SR-alpha promoter. This plasmid is transformed into CHO cells to express the HPS protein. The HPS protein can be used to diagnose hepatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  rat; probe; SR-alpha promoter;

                                                                                                                                                             11;
        This is the amino acid sequence of a human hepatocyte proliferation substance (HPS). The gene encoding the HPS was isolated from a lambda-gt10 human cDNA library using a fragment of the corresp. rat gene as a probe (sequence not given in the specification). The human gene was cloned in plasmid pSCL to produce plasmid pSVLH which was subsequently recombined to produce plasmid pcDLH-dhfr in which the HPS gene is under control of the SR-alpha promoter. The splasmid is transformed into CHO cells to express the HPS protein. The HPS protein can be used to diagnose
                                                                                                                                                                                                                                 341

This sequence is the human tyrosine kinase containing Ig and EGF homology domains (TIE) ligand of the invention, designated NL4. The TIE receptors are receptor tyrosine kinases which are expressed in vascular endothelial cells and early haemopoietic cells. The TIE receptors are believed to be actively involved in angiogenesis, and may play a role in haemopoiesis as well. The TIE ligand homologs can promote the survival and/or growth and/or differentiation of TIE receptor expressing cells. They can be used for promoting neovascularisation in wound healing and for promoting angiogenic processes, such as for inducing collateral vascularisation in a ischemic heart or limb, or for promoting bone development and/or maturation and/or growth in a patient or muscle growth and development. The TIE ligand homologs and antibodies can inhibit the growth of endothelial cells and induce apoptosis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated TIE ligand homologs for, e.g. developing products for

                                                                                                                                                                                                                                                                    AR-1, which is related to TIE ligands. AR-1 is believed to be a regulator of angiogenesis and thus the factor, as well as nucleic acids encoding it, are useful in the diagnosis and treatment of certain diseases such as neoplastic diseases involving tumour angiogenesis, wound healing, thromboembolic diseases, atherosclerosis and inflammatory diseases. AR-1 can also be used to support the survival and/or growth and/or migration and/or differentiation of human AR-1 receptor expressing cells. AR-1 can be used to identify the AR-1 receptor. AR-1-cytotoxic conjugates can be used to target tumours expressing AR-1 or its receptor. Its biological activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human TIE ligand; NL1; NL4; NL5; NL8; Ig homology domain; angiogenesis; EGF homology domain; receptor tyrosine kinase; vascular endothelial cell; early haemopoietic cell; haemopoiesis; necovascularisation; wound healing; endothelial cell; growth inhibitor; apoptosis inducer; tumour cell; vasculogenesis; detection; diagnosis; therapy.

cells, particularly tumour cells. They can inhibit vasculogenesis, particularly the vascularisation of tumour cells. The antibodies can also inhibit vascularisation of a cell in which a gene encoding an NLI, NLS, NLB or NL4 polypeptide is amplified. The products can also be used for detection, diagnosis, drug screening and production of transgenic

"Regulation of angiopoietin-2 mRNA levels in bovine microvascular:

T endothelial cells by cytokines and hypoxia.";

Circ. Res. 83:852-859(1998).

E PUNCTION: BINDS TO TIEZ PREEPFOR AND COUNTERACTS BLOOD VESSEL

MATURATION/STABILITY MEDIATED BY ANGIOPOIETIN-1 (ANG-1). ITS

FUNCTION MAY BE CONTEXT-DEPENDENT. IN THE ABSENCE OF ANGIOGENIC

INDUCERS, SUCH AS VEGF, ANG2-MEDIATED LOOSENING OF CELL-MATRIX

CONTACTS MAY INDUCE ENDOTHELIAL CELL ADOPTOSIS WITH CONSEQUENT

VASCULAR REGRESSION. IN CONCERT WITH VEGF, IT MAY PACILITATE

ENDOTHELIAL CELL MIGRATION AND PROLIFERATION, THUS SERVING AS A

PERMISSIVE ANGIOCENIC SIGNAL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DEVELOPMENTAL STAGE: FOUND TO BE EXPRESSED THROUGHOUT THE OVARIAN CYCLE. OVEREXPRESSED DURING LUTEOLYSIS, THIS COULD REFLECT THE REGRESSION OF CAPILLARIES THAT HAD DEVELOPED PERICYTE CONTACT IN

-1- FUNCTION: BINDS TO TIEZ RECEPTOR AND COUNTERACTS BLOOD VESSEL MATURATION/STABILITY MEDIATED BY ANGIOPOIETIN-1 (ANG-1). ITS FONCTION MAY BE CONTEXT-DEPENDENT. IN THE ABSENCE OF ANGIOGENIC INDUCERS, SUCH AS VOEGF, ANGZ-MEDIATED LOOSENING OF CELL-MATRIX CONTACTS MAY INDUCE ENDOTHELIAL CELL APOPTOSIS WITH CONSEQUENT VASCULAR REGRESSION IN CONCERT WITH VEGF, IT MAY FACILITATE ENDOTHELIAL CELL MIGRATION AND PROLIFERATION, THUS SERVING AS A PERMISSIVE ANGIOGENIC SIGNAL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  -!- SIMILARITY: CONTAINS A DOMAIN RELATED TO THE C-TERMINAL PART OF THE BETA AND GAMMA CHAINS OF FIBRINGEN.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 MATURATION/STABILITY MEDIATED BY ANGIOPOIETIN-1 (ANG-1). ITS FUNCTION MAY BE CONTEXT-DEPENDENT. IN THE ABSENCE OF ANGIOGENIC INDUCERS, SUCH AS VEGF, ANGZ-MEDIATED LOOSENING OF CELL-MATRIX CONTACTS MAY INDUCE ENDOTHELIAL CELL APOPTOSIS WITH CONSEQUENT VASCULAR REGRESSION. IN CONCERT WITH VEGF, IT MAY FACILITATE ENDOTHELIAL CELL MAPOPTOSIS WITH CONSEQUENT VASCULAR REGRESSION. IN CONCERT WITH VEGF, IT MAY FACILITATE DEPENDSLYE ANGIOGENIC SIGNAL.

DEVELOPMENTAL STAGE: FOUND TO BE EXPRESSED THROUGHOUT THE OVARIAN YECKESSION OF CAPILLARIES THAT HAD DEVELOPED PERICYTE CONTACT IN THE MIDSTAGE CORPUS LUTEON.

"Prediction of the coding sequences of unidentified human genes. I.
The coding sequences of 40 new genes (KIAA0001-KIAA0040) deduced by analysis of randomly sampled cDNA clones from human immature myeloid
